

Quotation / Calculator Form Examples

A few examples of interactive forms we've built where users enter information and the system calculates a result instantly.

1. Tyme Calculator

This is a quotation system for proposing prices of the company's products to clients. Multiple product categories are represented as tabs, and each product can contain multiple sub-products or services. Users select the required sub-products, enter hours/quantities, and the system auto-calculates the price based on predefined pricing formulas. Once complete, users export the selected products, calculated prices, and detailed price breakdown into a client-ready proposal.

2. TuffPoly — Material / Quote Calculator

A retaining-wall material estimator: users enter wall length, height, colour, and fencing options; the system instantly calculates the exact quantity of posts, sleepers, and brackets needed, shows a to-scale wall diagram, and lets the user add the matching products straight to a quote cart.
