

A few examples of interactive forms we've built where users enter information and the system calculates a result instantly.

This is a quotation system for proposing prices of the company's products to clients. Multiple product categories are represented as tabs, and each product can contain multiple sub-products or services. Users select the required sub-products, enter hours/quantities, and the system auto-calculates the price based on predefined pricing formulas. Once complete, users export the selected products, calculated prices, and detailed price breakdown into a client-ready proposal.

2. TuffPoly — Material / Quote Calculator

A retaining-wall material estimator: users enter wall length, height, colour, and fencing options; the system instantly calculates the exact quantity of posts, sleepers, and brackets needed, shows a to-scale wall diagram, and lets the user add the matching products straight to a quote cart.

Disclaimer: This calculator is intended as a guide only as there are variables that have not been considered. You must always check the final quantities, sleeper length and depth with your installer or engineer. TUFFPOLY assumes no responsibility for the results of the calculator and the options given.

3. Smart-Towkay — Mortgage Calculator

A loan repayment calculator: users enter property type, loan amount, tenure, and interest rate; the system instantly generates a full month-by-month repayment schedule (instalment, interest, principal, remaining balance).
